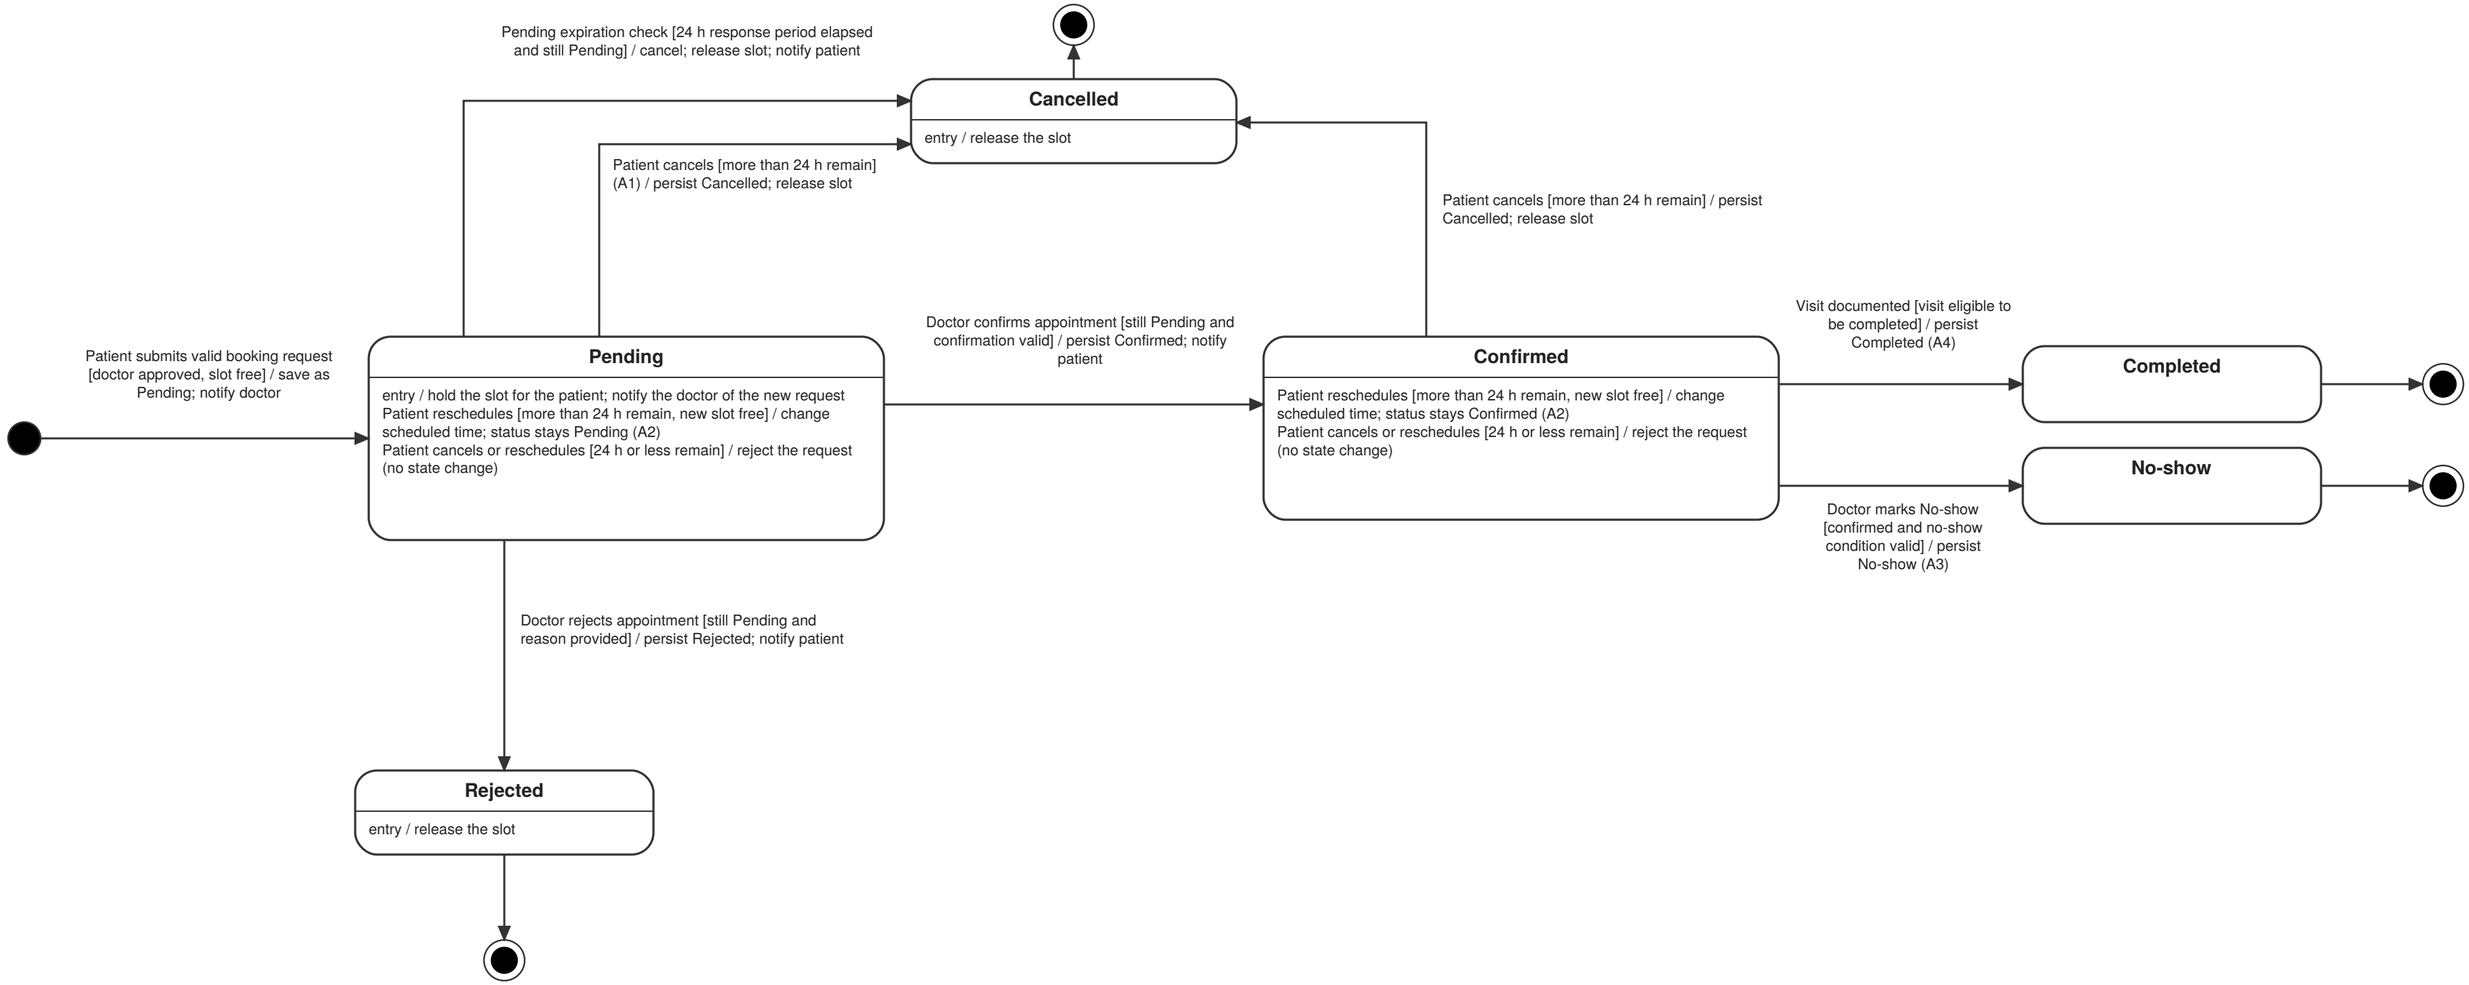
MediCare — Appointment Lifecycle State Machine

One appointment from creation to its final outcome. Transition label format: trigger [guard] / action. Internal transitions inside a state do not change the state.



A1 — The 24-hour cancellation rule is assumed to apply equally to Pending and Confirmed appointments (the rule speaks of 'an appointment').

A2 — Rescheduling is an operation, not a status ('Rescheduled' is not a documented status). The documents do not say whether a rescheduled appointment needs doctor re-approval; it is assumed to keep its current status (open question).

A3 — No-show is a documented status but its triggering rule is not defined. Assumed: the assigned doctor marks a Confirmed appointment as No-show after the scheduled start. Policy to be confirmed.

A4 — Confirmed → Completed occurs when the visit documentation workflow completes (medical record and prescription saved). Saving a medical record alone is not assumed to complete the visit.

A5 — The 24-hour response period is counted from the time the request was made (a creation timestamp is a proposed field). Rejected, Cancelled, Completed and No-show are terminal: a new booking creates a separate appointment; nothing is reversed.

A6 — A rejected cancellation or reschedule attempt (24 h or less remain, or new slot unavailable) is an internal transition: the appointment keeps its state and its time.
